

**ABSTRACT**

A method of processing barcoded tickets in a document processing device including receiving a stack of barcoded tickets in an input receptacle of a document processing device. Each barcoded ticket includes a document-identifier or ticket number  
5 that identifies the barcoded ticket. At least one specific document-identifier is inputted by the operator to search for a specific document in a stack of documents. Each of the documents are transported, one at a time, past a detector, which detects the document-identifier of each ticket. A determination is made whether a detected document-identifier matches the specific document-identifier requested by the operator, and if so, the ticket in  
10 question is directed to a pre-programmed or user-specified output receptacle.
